CHART №3

MEDIAN AND AVERAGE MONTHLY EARNINGS OF EMPLOYEES BY ECONOMIC ACTIVITY IN 2025 (GEL)

09.10.2026

INFORMATION NOTE

Given users' growing interest in wage statistics, the National Statistics Office of Georgia (Geostat) produces an additional labour statistics indicator – the median earnings of employees. It is calculated on the basis of data from the Revenue Service of the Ministry of Finance of Georgia and published annually.

To calculate the average monthly earnings, Geostat conducts a survey of enterprises and organizations, in which about 15 000 entities are surveyed quarterly and about 18 000 annually. The survey aims to collect aggregated data from enterprises and organizations on the gross earnings fund and the number of employees. These data allow only the calculation of the average monthly earnings and are not enough to determine the median earnings.

It should also be considered that in order to calculate the median earnings within the existing survey, it would be necessary to obtain individual data from enterprises/organizations, which would significantly increase the burden on respondents. Considering the mentioned circumstances, the calculation of the median earnings is entirely based on administrative data sources.

NOTE:

The classification of economic activities used in the release is NACE Rev. 2.
